

COMICCRAFT

Phase 1 – Brainstorming & Ideation

Project Title: ComicCraft – AI Comic Story Creator using Gemini Models

Phase Objective

The purpose of this phase is to identify the project idea, understand the creative problem, define the proposed AI-based solution, and establish the main objectives of ComicCraft. ComicCraft is planned as a web-based application that transforms a user's story idea into a personalized comic with storyline, narration, dialogue, illustrations, and an exportable PDF.

1. Project Idea

Comic creation normally requires separate skills for storytelling, dialogue writing, illustration, panel arrangement, and document preparation. The proposed idea is to combine these activities into one AI-assisted web application. A user provides a simple story prompt and preferences such as character name, setting, tone, and art style. The system then creates a panel-by-panel comic experience.

2. Creative Problem Identified

Many users may have creative story ideas but may not have the time or artistic skills needed to turn those ideas into complete comics. The project therefore explores an automated workflow that can assist with both written storytelling and visual comic creation.

3. Proposed Solution

ComicCraft combines Gemini-based text generation with Stable Diffusion-based image generation. The application accepts user preferences, generates structured comic content, creates visual illustrations, displays the result through a web interface, and supports comic export as a PDF.

Brainstorming: Project Vision & Goals

4. Project Vision

The vision of ComicCraft is to make AI-assisted comic creation accessible to non-artists, storytellers, and casual users. The application is intended to provide a simple path from imagination to a visually engaging comic.

5. Main Goals Identified During Ideation

- Allow users to enter a personalized comic story prompt.
- Allow customization through character name, setting, story tone, and art style.
- Generate a structured panel-by-panel storyline.
- Generate narration and character dialogue for the comic.
- Generate comic-style illustrations from image prompts.
- Display the generated comic sequentially in a web interface.
- Provide a downloadable PDF version of the completed comic.

6. AI Concept

The ideation identified two major AI tasks. The first is creative language generation: creating outlines, narration, scene descriptions, and dialogue. The second is visual generation: turning panel image prompts into comic-style illustrations. The project documentation identifies Gemini Flash and Gemini Pro for storytelling tasks and Stable Diffusion for illustration generation.

7. Expected User Experience

The intended experience is straightforward: the user supplies an idea and preferences, submits the form, reviews the generated comic panels, and can export the result. The interface is designed to keep the creation process simple and accessible.

Brainstorming: User Inputs & Creative Customization

8. User Input Ideas

Input	Purpose
Story Prompt	Main idea or storyline supplied by the user.
Character Name	Name of the main character or hero.
Setting	Location such as forest, school, city, or space.
Tone	Mood such as funny, dramatic, light-hearted, or poetic.
Art Style	Visual preference such as anime, pixel art, comic book, or realistic.

9. Creative Customization Concept

The brainstorming phase identified customization as an important part of the project. For example, changing the tone from dramatic to funny or changing the art style from a default style to comic-book or anime style should result in a different creative output. This supports iterative storytelling, where users can experiment with different combinations.

10. Example Idea

Example: A user enters the idea “A brave fox exploring an enchanted forest.” The user can select a character, forest setting, a chosen tone, and an art style. The application then uses these preferences as part of the comic-generation workflow.

11. Brainstorming Outcome

The outcome of ideation is a clear concept for a personalized AI comic generator rather than a generic text-generation application. The proposed system combines story generation and illustration generation into one workflow.

Brainstorming: User Scenarios & Workflow Idea

12. Scenario 1 – Personalized Comic Creation

A user enters a story prompt such as a brave fox exploring an enchanted forest. The user also specifies the character name, setting, tone, and art style. The system generates a complete comic strip with multiple panels, text, and illustrations.

13. Scenario 2 – Changing Tone and Art Style

A user wants a light-hearted and cartoonish comic. The user changes the tone to funny and the art style to comic book. The application regenerates the creative pipeline using the updated preferences, allowing the user to explore different versions of the same basic idea.

14. Scenario 3 – Comic Export

After reviewing the generated comic, the user wants a permanent copy. The proposed workflow assembles panel titles, images, and text into a structured layout and compiles the comic into a PDF. The user can then save, print, or share the resulting comic.

15. Initial Workflow Concept

Step	Idea
1	User enters story prompt and preferences
2	AI creates a structured comic outline
3	AI expands the outline into narration and dialogue
4	Image generation creates illustrations for panels
5	Frontend displays the comic preview
6	Comic content is organized for export
7	Final comic is exported as PDF

This workflow gives the project a clear end-to-end creative direction and becomes the foundation for the next phases: requirements analysis, design, planning, development, testing, documentation, and demonstration.

Phase 1 Conclusion & Ideation Output

16. Final Ideation Summary

The brainstorming and ideation phase establishes ComicCraft as an AI-powered web application for personalized comic creation. The central idea is to reduce the effort required to transform a simple story concept into a complete comic by combining AI-generated writing and AI-generated illustrations.

17. Key Ideas Finalized

- A web-based AI comic creation application.
- User-driven story prompts and creative preferences.
- Structured panel-by-panel comic generation.
- AI-generated narration and character dialogue.
- AI-generated comic-style illustrations.
- A browser-based comic preview.
- PDF export of the generated comic.

18. Expected Outcome of Phase 1

At the end of this phase, the project has a clearly defined creative concept, target user experience, major features, customization inputs, example scenarios, and an initial workflow. These ideas provide the foundation for preparing detailed functional and technical requirements in Phase 2.

19. Transition to Phase 2

The next phase, Requirement Analysis, will convert the ideas identified here into specific functional requirements, non-functional requirements, technology requirements, inputs, outputs, and system constraints.

Project: ComicCraft – AI Comic Story Creator using Gemini Models

Phase: 1 – Brainstorming & Ideation
